

Final Project Documentation & Reflection

Project Title

Student Management System

Project Objective

The objective of this project is to develop a simple, responsive, and interactive web application for managing student records. The system allows users to add, search, filter, sort, edit, and delete student information through an easy-to-use interface.

Project Overview

The Student Management System is a web-based application developed as the final project of the Web Development Internship. It provides a structured way to manage student details such as name, email, course, and marks. The application dynamically displays student records and updates the information whenever the user performs an action. It also displays statistics such as total students, average marks, and highest marks.

Technologies Used

HTML5, CSS3, JavaScript, Git, GitHub, and GitHub Pages were used to develop and deploy the project.

Main Features

The main features include adding new student records, editing existing records, deleting records, searching students by name, filtering students by course and result, and sorting students according to marks. Form validation is also implemented to ensure that valid student information is entered. The website is responsive and works on different screen sizes.

Website Screenshots

The following screenshots demonstrate the project interface and its interactive functionality.

Challenges Faced

One of the main challenges was making the student records update dynamically without refreshing the webpage. Another challenge was implementing multiple features such as search, filtering, sorting, editing, and deleting while keeping the code organized. Deploying the project using GitHub Pages was also a new experience.

Solutions Implemented

I used JavaScript functions, arrays, objects, DOM manipulation, and event listeners to manage and update student records dynamically. I tested each feature individually and fixed errors whenever necessary. Git and GitHub were used for version control and deployment.

Key Learnings

Through this project, I learned how to combine HTML, CSS, and JavaScript to create a complete interactive website. I improved my understanding of functions, arrays, objects, DOM manipulation, events, form validation, responsive design, Git, GitHub, and GitHub Pages deployment.

Future Improvements

In the future, I would like to add a database for permanent data storage, user authentication, student profile images, advanced filtering, and additional reports or dashboards.
